

VENA AURUM LLC

# START WHERE GOLD HAS ALREADY BEEN DOCUMENTED.

Hozho + Akei | Stanton, Arizona

**41.32 recorded acres | $23,900 together**

## Why this ground deserves a serious look

Two adjoining active lode claims next to the historic Leviathan-Germanic mining area, with primary-source documentation of gold production, underground workings, a mapped quartz-vein system, and renewed exploration interest.

- **Real historical assays**
  Five selected 1977 Leviathan samples returned 0.106-0.956 ounces of gold per ton, recorded on an original laboratory certificate with matching sample-position map.
- **An identifiable geological question**
  1937 and 1984 engineers described southwest-trending veins, fault offsets and possible structural intersections toward the surrounding area.
- **Two adjoining claims**
  Hozho (AZ106748919, 20.6600 ac) and Akei (AZ106748920, 20.6612 ac), both shown as active in seller-supplied BLM records.

**ASKING PRICES**

**Hozho $14,900** **Akei $11,900** **Both $23,900**

Unpatented lode claim interests; not a sale of fee-simple land.

# WHAT THE DOCUMENTS ACTUALLY PROVE

## Primary documentary evidence

### 1883 / 1911 MINERAL SURVEYS

The original Leviathan mineral survey (MS 580) and Germanic-adjoining group survey (MS 2888) establish the history and original arrangement of the mining properties. They are not modern boundary surveys.

### 1937 ENGINEERING DESCRIPTION

Engineer J. W. Neill recorded the main Leviathan vein trending approximately S65 W, a northward dip, western step faulting, and smaller veins near Germanic/Denver. Continuity was his interpretation, not a drill-proven resource.

### 1977 LABORATORY ASSAYS

Iron King Assay Office certificate dated January 14, 1977 reports samples 1416-1420 at 0.302, 0.118, 0.390, 0.106 and 0.956 oz/ton Au. A contemporaneous map plots those samples on historic Leviathan.

### 1983-1984 EXPLORATION

The archive discusses Homestake mapping and sampling and Los Suertes geophysics/drilling. Butler proposed additional drill holes; his proposal does not show that those holes were drilled. He also described earlier results as not significantly ore-grade.

## Seller-supplied information still requiring verification

Recent sampling across Hozho and Akei was reported at about 3 g/ton gold in placer material; gold-colored concentrates were photographed; a possible subsurface mineralized zone has been described. No independent laboratory chain-of-custody or formal resource estimate was supplied for the claims.

## What a buyer should verify

Original claim-location notices and monument positions; current BLM status, fees and assignments; access and patent adjacency; independent assays on the offered ground; mineral rights, geologic continuity, and any permissions for exploration. Historical nearby assays are not the grade of these claims.

**THE PROPOSITION**

Not proven reserves. A documented gold-bearing historic neighbor, modern adjoining claims, and a specific exploration hypothesis supported by primary records.
